FINAL YEAR PROJECT PROPOSAL

Personal Expense Tracker System

A Web-Based Application for Managing Income and Expenses

Project Title	Personal Expense Tracker System
Project Domain	Web Application / Personal Finance Management
Programming Language	Python
Framework	Flask
Database	SQLite

Prepared for academic project proposal submission

1. Introduction

Managing personal income and daily expenses is important for maintaining a healthy budget. Many people record their spending manually, which can be time-consuming and make it difficult to understand where their money is going. The Personal Expense Tracker System will provide a simple web-based solution for recording income and expenses, organizing transactions, and reviewing spending summaries.

2. Problem Statement

People may find it difficult to keep accurate records of daily expenses, calculate their remaining balance, and monitor monthly spending. Manual records can be misplaced and do not easily provide summaries or visual reports. This project aims to provide an organized and user-friendly system to help users manage these tasks.

3. Aim and Objectives

The main aim is to develop a simple web application that helps users track their income and expenses. The objectives are:

- Allow users to register and log in securely.
- Add, view, edit, and delete income and expense transactions.
- Categorize transactions, such as food, transport, bills, education, and salary.
- Calculate total income, total expenses, and remaining balance automatically.
- Set a monthly budget and show a warning when spending approaches the limit.
- Display summaries and charts to help users understand their spending.

4. Proposed Features

The system will include a dashboard, user authentication, transaction management, expense categories, monthly budget tracking, and basic reports. Users will be able to filter transactions by date or category and view a summary of their financial activity.

5. Technologies

Python: Main programming language for application logic.
Flask: Python web framework used to build the application.
HTML: Structure of web pages.
CSS: Styling and page layout.
SQLite: Database for storing user and transaction records.
Chart.js (optional): For displaying expense charts and visual summaries.

6. Methodology

The project will be developed in stages: requirements collection, interface design, database design, implementation, testing, and documentation. The application will be tested to verify that users can sign in, manage transactions, calculate totals correctly, and view budget and report information.

7. Expected Outcome

The expected outcome is a working web application that provides a clear record of income and expenses, calculates balances automatically, and helps users monitor their budget. The application will run locally in a web browser during development and demonstration.

8. Scope and Limitations

The initial version is intended for personal budgeting and basic expense tracking. It will not connect directly to bank accounts or process payments. Advanced features such as cloud synchronization or bank integration may be considered for future improvement.

9. Conclusion

The Personal Expense Tracker System is a practical project that applies Python web development and database concepts to a common everyday problem. Its features are manageable for a student project and can be expanded as needed after supervisor feedback.
